

Why is a Huber needle needed?

Standard needle

Huber needle

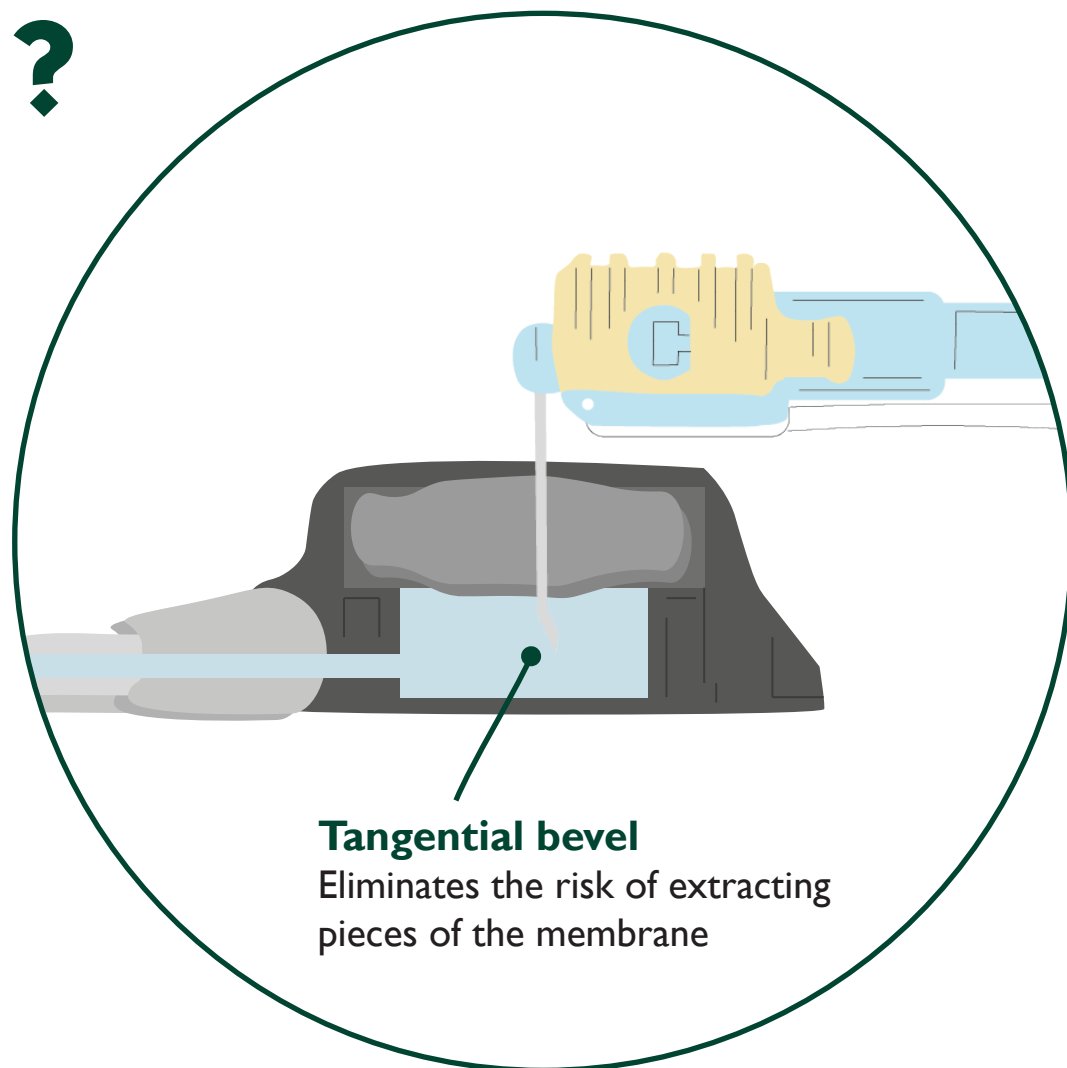

Special Bevel

Tangential bevel

Eliminates the risk of extracting pieces of the membrane

Importance of Using the Correct Huber Needle

The needle used must always be specifically designed for access ports. A Huber (non-coring) needle is designed to penetrate the septum without causing damage, helping to preserve the integrity of the device over time.

Using an inappropriate needle may lead to deterioration of the septum and compromise the performance and longevity of the port.
